

Next.js + Supabase Starter Checklist - Mohamed Dhia Arfa

Project setup: TypeScript, ESLint, Tailwind, App Router

Env vars: .env.local, .env.example kept in sync, never committed

Supabase: project created, anon + service role keys separated

Auth: providers configured, redirect URLs set for prod + preview

Database: RLS enabled on every table before any real data

Row-level policies written and tested per role, not just admin

API routes: server-only secrets never exposed to the client

Deployment: env vars mirrored in Vercel, preview + production
